Lasso Regression

- LASSO $\longrightarrow$ Least absolute shrinkage and selection operator

Lasso Regression

- LASSO $\longrightarrow$ Least absolute shrinkage and selection operator
- Popular as it leads to a sparse solution.

Constructing the Objective Function

- Find a $\boldsymbol{\theta}_{\mathsf{opt}}$ such that

$$\boldsymbol{\theta}_{\mathsf{opt}} = \arg\min_{\boldsymbol{\theta}} (\mathbf{y} - \mathbf{X}\boldsymbol{\theta})^T(\mathbf{y} - \mathbf{X}\boldsymbol{\theta}) : \; ||\boldsymbol{\theta}||_1 < s \tag{1}$$

Constructing the Objective Function

- Find a $\boldsymbol{\theta}_{\text{opt}}$ such that

$$\boldsymbol{\theta}_{\text{opt}} = \arg\min_{\boldsymbol{\theta}} (\mathbf{y} - \mathbf{X}\boldsymbol{\theta})^T(\mathbf{y} - \mathbf{X}\boldsymbol{\theta}) : \ ||\boldsymbol{\theta}||_1 < s \qquad (1)$$

- Using KKT conditions

$$\boldsymbol{\theta}_{\text{opt}} = \underbrace{\arg\min_{\boldsymbol{\theta}} (\mathbf{y} - \mathbf{X}\boldsymbol{\theta})^T(\mathbf{y} - \mathbf{X}\boldsymbol{\theta}) + \delta^2||\boldsymbol{\theta}||_1}_{\text{convex function}} \qquad (2)$$

Solving the Objective

- Since $||\boldsymbol{\theta}||_1$ is not differentiable, we cannot solve,

$$\frac{\partial(\mathbf{y} - \mathbf{X}\boldsymbol{\theta})^T(\mathbf{y} - \mathbf{X}\boldsymbol{\theta}) + \delta^2||\boldsymbol{\theta}||_1}{\partial\boldsymbol{\theta}} = 0 \tag{3}$$

Solving the Objective

- Since $||\boldsymbol{\theta}||_1$ is not differentiable, we cannot solve,

$$\frac{\partial (\mathbf{y} - \mathbf{X}\boldsymbol{\theta})^T (\mathbf{y} - \mathbf{X}\boldsymbol{\theta}) + \delta^2 ||\boldsymbol{\theta}||_1}{\partial \boldsymbol{\theta}} = 0 \tag{3}$$

- How to Solve? Use coordinate descent!

LASSO and feature selection

- LASSO inherently does feature selection!

LASSO and feature selection

- LASSO inherently does feature selection!
- Sets coefficients of "less important" features to zero.

LASSO and feature selection

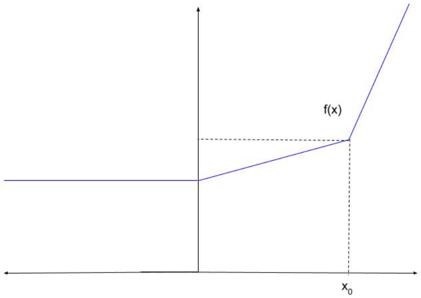
- LASSO inherently does feature selection!
- Sets coefficients of “less important” features to zero.
- Sparse and memory efficient and often more interpretable models.

Subgradient

- Generalises gradient to convex but non-differentiable problems
- Examples:
  - $f(x) = |x|$

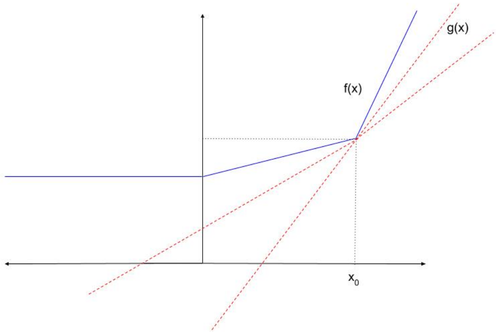
Task at hand

- TASK: find derivative of $f(x)$ at $x = x_0$



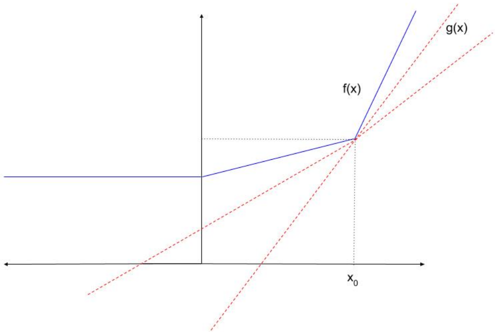
Solution

- Construct a differentiable $g(x)$
  - Intersecting $f(x)$ at $x = x_0$
  - Below or on $f(x)$ for all x



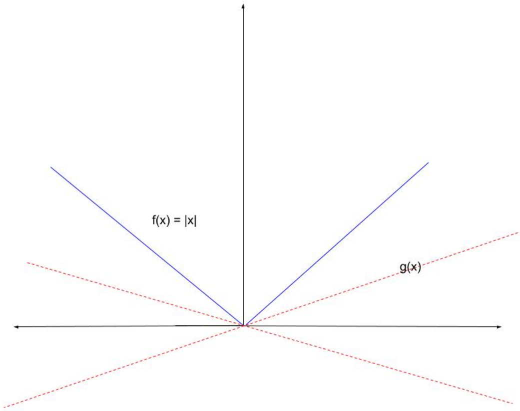
Solution

- Compute slope of $g(x)$ at $x = x_0$



Another Example: $f(x) = |x|$

- Subgradient of $f(x)$ belongs to $[-1, 1]$



Coordinate Descent

- Another optimisation method (akin to gradient descent)
- Objective: $\min_{\boldsymbol{\theta}} f(\boldsymbol{\theta})$

Coordinate Descent

- Another optimisation method (akin to gradient descent)
- Objective: $\min_{\boldsymbol{\theta}} f(\boldsymbol{\theta})$
- Key idea: Sometimes difficult to find minimum for all coordinates

Coordinate Descent

- Another optimisation method (akin to gradient descent)
- Objective: $\min_{\boldsymbol{\theta}} f(\boldsymbol{\theta})$
- Key idea: Sometimes difficult to find minimum for all coordinates
- ..., but, easy for each coordinate

Coordinate Descent

- Another optimisation method (akin to gradient descent)
- Objective: $\min_{\boldsymbol{\theta}} f(\boldsymbol{\theta})$
- Key idea: Sometimes difficult to find minimum for all coordinates
- ..., but, easy for each coordinate
- turns into a one-dimensional optimisation problem

Coordinate Descent : Example

Learn $y = \theta_0 + \theta_1 x$ on following dataset, using coordinate descent where initially $(\theta_0, \theta_1) = (2, 3)$ for 2 iterations.

x	**y**
1	1
2	2
3	3

Coordinate Descent : Example

Our predictor, $\hat{y} = \theta_0 + \theta_1 x$

Error for i^{th} datapoint, $\epsilon_i = y_i - \hat{y}_i$
$\epsilon_1 = 1 - \theta_0 - \theta_1$
$\epsilon_2 = 2 - \theta_0 - 2\theta_1$
$\epsilon_3 = 3 - \theta_0 - 3\theta_1$

$$\text{MSE} = \frac{\epsilon_1^2+\epsilon_2^2+\epsilon_3^2}{3} = \frac{14+3\theta_0^2+14\theta_1^2-12\theta_0-28\theta_1+12\theta_0\theta_1}{3}$$

Iteration 0

$$\text{MSE} = \frac{1}{3}(14 + 3\theta_0^2 + 14\theta_1^2 - 12\theta_0 - 28\theta_1 + 12\theta_0\theta_1)$$
